

Access Switch Speed Requirements

Overview

Port Speed: The access switches commonly come with 10/100/1000Mbps data transmission speed. Switching capacity, sometimes referred to as "backplane bandwidth," represents the total amount of data a switch can process through all of its ports at any given time. It's measured in gigabits per second (Gbps) or terabits per second (Tbps). Imagine a switch as a busy airport: the switching. For instance an access switch with 48 Cooper ports is capable of "X" Gbps of bandwidth. How is this calculated and why is this important if you know you get a 1G on each port?

07-01-2020 10:10 AM Okay, understand the hardware that actually transmits/receives frames on a port, externally. Simply put, access switches are the ones that connect your devices (like PCs, printers, phones, etc. They do this by. An access switch is a network edge device that directly connects end-user hardware such as computers, IP phones, wireless access points, cameras, and IoT devices to the broader network. Within the OSI model, it works on a data link.
