

Aggregation Switch Monitoring System

Overview

LACP is a dynamic protocol that automatically discovering and configures aggregated links between switches. Test access points (TAP) aggregation is an alternative solution to help with monitoring and troubleshooting tasks in the data center. Unlike port mirroring, TAP aggregation provides N:M (any-to-any) packet replication, allowing you to capture different types. Traffic aggregators bring together traffic from taps (test access points) and SPANs ports (switched port analyzers) across the network, giving a pervasive view into information-in-motion, and optimize monitoring tools by filtering on traffic that matters. Traffic aggregators are typically known as. Arista DANZ provides the ability to cost-effectively capture and analyze all traffic and flows in a datacenter or service provider network for enhanced visibility, security and troubleshooting without the prohibitive costs and scaling limitations of traditional Network Packet Brokers. By bundling multiple network connections into a single high-bandwidth link. This document provides campus networks typical configuration examples and feature typical configuration examples.
