

Bahrain Polarization-Maintaining Fiber Optic OM4

Overview

Polarization-maintaining fibers work by intentionally introducing a systematic linear birefringence in the fiber, so that there are two well defined polarization modes which propagate along the fiber with very distinct phase velocities. The beat length L_b of such a fiber (for a particular wavelength) is the distance (typically a few millimeters) over which the wave in one mode will experience a. OverviewIn, polarization-maintaining optical fiber (PMF or PM fiber) is a single-mode in which , if properly launched into the fiber, maintains a linear polarization during. In an ordinary (non-polarization-maintaining) fiber, different polarization modes have the same nominal due to the fiber's circular symmetry. in such a fiber, or bending. Several different designs are used to create birefringence in a fiber. The fiber may be geometrically asymmetric or have a refractive index profile which is asymmetric such as the design using an elliptical as.
