

Cambodia Bryon Optical Time Domain Reflectometer

Overview

We present a novel distributed Brillouin optical time domain reflectometer (BOTDR) using standard telecommunication fibers based on single-photon avalanche diodes (SPADs) in gated mode, hd-BOTDR, with a range of 120 km and 10 m spatial resolution. In the past two decades Brillouin-based sensors have emerged as a newly-developed optical fiber sensing technology for distributed temperature and strain measurements. Instead of using a frequency scan like conventional BOTDR, we use a frequency discriminator based on the. e an essential tool for: characterisation, certification, maintenance and monitoring optical networks. They characterise the length, attenuation and return loss (ov se individual events along ink: connection points (splices, connectors), te ng by particles much smaller than the wavelength of the. Distributed fiber optic sensors are used to monitor civil infrastructures and detect earthquakes and for energy trans-port surveillance. Over the past 20 years, various technological and numerical advances have pushed back the limits of these sensors and diversified their applications. In this paper, the mechanism of rapid BOTDR measurement.
