

# Current branches of passive optical splitters

## Overview

Splitters are passive optical devices that divide or combine optical signals, and they come in various types, including power splitters, uneven splitters, and wavelength-division multiplexing (WDM) splitters. Each type serves specific applications, enabling efficient use of. The Global Passive Optical Splitter Market, a critical enabler of high-speed communication networks, was valued at an estimated \$53. Projections indicate robust expansion, with the market expected to reach approximately \$125.7 billion by 2034, exhibiting a compound annual growth. Where splitters are placed in the network can make significant impacts on fiber counts, network cost and deployment time and operational steps, such as customer onboarding and maintenance. One important note is that splitting architectures should be seen as tools that can be mixed and matched to. A Passive Optical Network (PON) is a fiber optic technology utilizing point-to-multipoint topology and optical splitters to deliver data from a single transmission point to multiple user endpoints. Passive refers to the unpowered condition of the fiber and splitting/combining components.
