

Fiber optic communication and computing

Overview

This section describes our proposed on-fiber photonic computing and its networking-related challenges. Computing operations are typically executed above the network stack, while the communication data are carried on fibers beneath. This section describes our proposed on-fiber photonic computing and its networking-related challenges. Computing operations are typically executed above the network stack, while the communication data are carried on fibers beneath the network stack. Connecting these two cross-layer functions is non-trivial, even though they may use the same physical layer.

- Hardware Networking hardware; Emerging optical and photonic technologies;
- Networks Physical links; In-network processing; Wide area networks;

→ Photonic computing is a powerful technology to perform fast and energy-efficient computation in the analog domain. This paper argues for a paradigm shift wherein the network performs photonic computing while the data is on fiber. Our proposal leverages the fact that today's networks already convert digital data to photons using commodity transponders.
