

Fiber optic sensor current overload

Overview

The interference pattern relative to a reference waveform is an optical intensity value corresponding to the current magnitude. Such sensors are often employed in applications where galvanic isolation is required, as the glass fiber is an excellent electrical insulator. Overview A current sensor (FOCS) is a device designed to measure. Utilizing a single-ended optical fiber wrapped around the current conductor, FOCS exploits the (Interferometric fiber optic current sensors (FOCS) employ circularly polarized light traversing a closed loop path around an electrical conductor's current-generated magnetic flux, which reflects off a mirror. The light ex. As FOCS are resistant to effects from magnetic or electrical field interferences, they are ideal for the measurement of electrical currents and high voltages in or other environme.
