

How to access the core switch to check the loopback

Overview

You can verify your setting by entering the show loopback-detection Privileged EXEC command. Use the loopback-detection enable command to globally. It can not be determined just by physical inspection or log analysis on which switch the issue lies. Sign in to view the entire content of this KB article. New to. To check for a loopback in a switch, you typically rely on the switch's built-in loopback detection mechanisms and verify their status through specific command-line interface (CLI) commands. A common method to ascertain if loopback detection is active and to view its status involves using a command. The problem happening is that the core switch is disabling one uplink configured as a lag to one of the edge cabinets, when viewing the logs on the core, i found the below : LOOP DETECTION: VLAN 102, port lg110 detect, putting into err-disable state after disabling, reenabling the lag ports on the. Yeah, loopbacks are used for dynamic routing protocols. STP is a network protocol designed to prevent network loops in Ethernet networks, it creates a spanning.
