

Laser Diode Driver Circuit LM

Overview

In this project LASER diode driver circuit is developed with adjustable voltage regulator LM317 to drive red color 650nm 50mW laser diode. We can adjust the intensity of light by this circuit. A LASER (Light Amplification by Stimulated Emission of Radiation) diode package comprises two semiconductors in one package. It has a wide range of. Last updated on 26 July 2025 by Admin-Lavi Leave a Comment One way to give steady current to laser diode is using a Simple Laser Diode Driver Circuit using IC LM317. Laser diode are very sensitive to current and with wrong current can damage it. Out of hundreds of different uses Laser technology has to offer, one major use is the application of laser as an effective cutting tool. 35mA, and a larger resistor can be used to push less simulate this circuit - Schematic created using CircuitLab To push less current, best to put a shunt resistor across the laser; currents. When a constant current is injected, optical output power; P_o of LD changes by the temperature. The example when 30mA is injected to LD on graph1 is as follows. If T_c is 60 degrees, P_o might be about 1mW.
