

Laser Modules and Laser Diodes

Overview

There are green laser diode modules with an internal frequency doubler. Such a module may contain an amplified single-mode laser diode and a nonlinear waveguide, for example. Some laser diode modules are fiber-coupled, i.e., directly launch the generated light into an optical fiber ("pig-tailed" laser diodes). For limited optical power, this may be a single-mode-fiber, which might even be polarization-maintaining, as the output is often linearly polarized. Otherwise, multimode fibers are common, and are the only option a. In some cases, the built-in electronics have an input for power modulation. Others are meant for continuous-wave operation with constant power only. It is possible to obtain nanosecond or even picosecond light pulses from laser diode modules. For example, there are gain-switched modules with integrated driver electronics – which is important as very short electrical connections should be used for that mode of operation. In other cases, one uses quasi-continuous-wave operation with much longer pu.
