

Mozambique Well Logging Fiber Optic Cable Technology

Overview

Distributed fiber optic vibration signal logging is a technology that uses fiber optics to sense the vibration signals returned from different formations or well walls to analyze the surrounding formation characteristics or downhole events, which has the advantages of. Distributed fiber optic vibration signal logging is a technology that uses fiber optics to sense the vibration signals returned from different formations or well walls to analyze the surrounding formation characteristics or downhole events, which has the advantages of. The northern Mozambican port of Nacala has been linked to the world's largest submarine fibre-optic cable system to improve digital communications, enabling the telecommunications company Vodacom to offer its customers a direct international gateway for faster and more reliable internet services. Subsea cables are the global backbone of the Internet, connecting people, businesses, and economies around the world. They connect us to the cloud, deliver streaming video, and increase efficiency and productivity for business. Subsea cables' importance is all the more apparent during the Covid19. Telecommunications operator Vodacom announced this Tuesday, August 15, the arrival of the first submarine fiber optic cable in northern Mozambique, guaranteeing that it will support the growth of the country's digital economy.
