

New Energy Internet Layout

Overview

The Energy Internet adopts the mechanism of “regional coordination and hierarchical control” to realize the clean power compatibility and reliability in power operation. It improves a reliability of the system, and provides an increased utilization of energy resources by integrating the smart grid with the. Part of the book series: Communications in Computer and Information Science (CCIS,volume 913)) With the development of economy, the number of substations and the number of lines is continuously increasing, and the Energy Internet is becoming increasingly complex and changes frequently. First, this paper. Abstract—This paper focuses on the management of the electricity grids using energy packets to build the Energy Internet via machine-type communications. We revisit some attempts to design a digital grid similar to the internet, including packetized management of specific loads (electric vehicles).
