

Optical cable anti-interference capability

Overview

Non-conductivity: Optical fiber cables are made of glass or plastic fibers and are non-conductive, thus not affected by electromagnetic interference (EMI) and radio frequency interference (RFI). To mitigate these issues, anti-electromagnetic interference optical fiber cables have emerged as a reliable and secure solution. Hence, these sensors are widely used in industrial manufacturing, physics research, and aviation transportation. Illustration of the structure of an FPI sensor. The interference happens with coaxial cables but not with fiber optic cables as the signal. Balanced high frequency cables are the basis of the horizontal cabling of today's data communications infrastructure. By adding a screen, the protection can. Important areas in key industries require long-distance perimeter inspection, 24-hour full perimeter coverage, anti-interference from external environments, and intelligent analysis of intrusion events.
