

# Optical module TX and RX values

## Overview

In multi-mode fiber, especially with 850nm optics (like SX modules), TX power typically ranges from -9 to -3 dBm, and RX can receive down to -17 dBm. These links are ideal for short distances up to 550 meters using OM3 or OM4 fiber. The TX (transmit) and RX (receive) power levels significantly affect everything from signal strength to transmission distances and the overall optical power. In optical communication systems, the transmit power and receive power of an optical transceiver are among the key indicators used to evaluate link quality and module operating status. They play an important role during new link deployment, compatibility testing, and link troubleshooting. We called the optical Tx power the signal level that leaves the optical equipment and the Tx power should be within the transmitter power range. What is RX/TX Optical Power Calculation?

Simply put, this calculation is done to find out the difference.
