

Precision Machining of Optical Module Structural Components

Overview

Precision machining with diamond cutting tools enables the fabrication of highly complex micro-optical components. This technology allows manufacturers to achieve surface qualities at the sub-micron level, making it ideal for freeform surfaces and intricate 3D structures. As optical components become more intricate and complex, precision machining has reached new levels of sophistication. While traditional methods like grinding and polishing have long been used for spherical optics, they often fall short in achieving the dimensional accuracy needed for more advanced. The ModuleWorks Optics package precisely computes toolpath positions by leveraging accurate mathematical representations of the workpiece geometry. It works directly with hybrid inputs in a single 3D CAM solution.
