

Requirements for Plastic Cables in Computer Room Maintenance

Overview

Use proper spacing, cable trays, and Velcro ties (not zip ties) to secure cables without over-tightening them. Conduct regular audits to check for loose connections, worn cables, or disorganization that may have developed over time. Preventative care ensures longevity and network. NEC 800-51 Listing Requirements states that Type CMP communications plenum cable be listed as suitable for use in ducts, plenums, and other spaces used for environmental air, and also be listed as having adequate fire-resistant and low smoke-producing characteristics. With all of the new code changes in Article 645, electricians installing or working in IT rooms would do best reading all 4 pages of Article 645 from beginning to end. Clearly labeling and documenting cables helps prevent confusion and reduces troubleshooting time. A well-maintained cable labeling system ensures that IT personnel can quickly identify and replace cables. The general rules are: Label both ends of every cable.
