

Surface Mount Technology for Optical Communication Modules

Overview

As optical module design pushes for tighter layouts and lower parasitics, Surface Mount Technology (SMT) becomes a foundational manufacturing choice. SMT shortens interconnect paths, supports dense multi-layer PCBs, and streamlines high-volume builds—all critical in optical. So are thermal constraints, component counts, and performance demands in everything from AI servers to metro switches. SMT shortens interconnect. Glenair PCB mount transceivers are ruggedized harsh-environment equivalents to SFP and QSFP transceivers but with mechanical design suited to the harsh temperature and vibration environments found in Military, Aerospace, Oil and Gas, Railway, and Industrial applications. These rugged Tx, Rx, and Samtec's FireFly™ Micro Flyover System™ embedded and rugged mid-board optical transceivers take data connection "off board" for up to 28 Gbps per lane with a path to 112 Gbps PAM4 via optical cable at greater distances, or copper for cost optimization. To solder many leads at once, a method called flow-through soldering is used.
