

# Two switches for dual aggregation

## Overview

MC-LAG (Multi-Chassis Link Aggregation Group) allows two switches to work together as a single logical unit, providing both load balancing and redundancy. For example, two 10-gigabit Ethernet ports, one each from two MLAG configured switches, can connect to two 10-gigabit ports on a host, switch, or network device to create a link that. Switch-to-Switch Aggregation: This is useful in scenarios where you need to interconnect multiple switches to increase the bandwidth available between them and ensure network redundancy. It helps in managing higher traffic loads between switches. Switch-to-Client Aggregation: This is beneficial. We're planning to purchase 2 x WS-C3750G-12S-E core switches and a WS-C2960G-48TC-L access switches. Which means, there will be a fiber link from WS-C2960G-48TC-L to the first core and. Link Aggregation is a nebulous term used to describe various implementations and underlying technologies.
