

What a semiconductor optical modulator looks like

Overview

Optical modulators can be implemented using Semiconductor Nano-structures to increase the performance like high operation, high stability, high speed response, and highly compact system. Overview An is an optical device which is used to modulate a beam of light with a perturbation device. It is. An electro-optic modulator is a device which can be used for controlling the power, phase or polarization of a laser beam with an electrical control signal. It typically contains one or two, and possibly. Acousto-optic modulators are used to vary and control laser beam intensity. A Bragg configuration gives a single first order output beam, whose intensity is directly linked to the power of RF control signal. The rise time. A dc magnetic field H_{dc} is applied perpendicular to the light propagation direction to produce a single domain, transverse directed $4 \sim 10$ ms. The rf modulation field H_{rf} , applied by means of a coil along t .
