

Why does an OLT still need a core switch

Overview

It converts optical signals from fiber to electrical signals, forwarding them to a core Ethernet switch. OLTs replace multiple layer 2 switches at distribution points and distribute signals via backbone or horizontal cabling through optical splitters to optical network. In the age of fiber-to-the-home (FTTH) and ultra-broadband connectivity, the Optical Line Terminal - or OLT - is one of the most crucial devices powering our high-speed digital world. When you stream a 4K video, join a remote meeting, or play an online game on a gigabit fiber connection, an OLT. An optical line termination (OLT), also called an optical line terminal, is a device which serves as the service provider endpoint of a passive optical network. But there has to be at least one core switch on larger ones.

Optical line termination

An optical line termination (OLT), also called an optical line terminal, is a device which serves as the service provider endpoint of a passive optical network. It provides two main functions: 1. to perform conversion between the electrical signals used by the service provider's equipment and the fiber optic signals used by the passive optical network.
